The polypeptides and/or polynucleotides are also useful for homologous or related genes, producing compositions that modulate the expression or function of the receptors, gene therapy, mapping functional regions of the receptors, studying associated physiological pathways, in vivo prophylactic and therapeutic purposes, as immunogens for producing antibodies, and for identifying biologically active agents. The polypeptides contain a G-protein coupled seven transmembrane region and a leucine rich repeat extracellular domain. These regions capture and facilitate optimal orientation of its ligand. The proteins are also expressed in diverse tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents the human G-protein coupled receptor having extracellular leucine rich repeat regions, designated LGR7 long form. The LGR4, LGR5 and LGR7 proteins are used to identify ligands for the receptor. The polypeptides and/or polynucleotides are also useful for homologous or related genes, producing compositions that modulate the expression or function of the receptors, gene therapy, mapping functional regions of the receptors, studying associated physiological pathways, in vivo prophylactic and therapeutic purposes, as immunogens for producing antibodies, and for identifying biologically active agents. The polypeptides contain a G-protein coupled seven transmembrane region and a leucine rich repeat extracellular domain. These regions capture and facilitate optimal orientation of its ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New G-protein coupled

                     their corresponding DNA molecules. GPCR is also referred as seven transmembrane receptor. G protein coupled receptor protein is useful for treating neurological disorder, particularly schizophrenia. GPCR protein is also useful for identifying compounds useful for treating schizophrenia. These compounds are also useful for treating other neurological and psychiatric diseases, e.g. depression, anxiety, bipolar disease, affective disorders, attention deficit hyperactivity disorder, attention deficit disorder, epilepsy, neuritis, neurostathenia, neuropathy, neurosis, Alzheimer's disease, Parkinson's disease, migraine and senile dementia. The invention also provides genetic screening procedures that entail analysing a person's genome with respect to GPCR. The vectors are useful for the recombinant production of the GPCR's. The present sequence is human CON222 G protein-coupled receptor (GPCR) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        27-OCT-1999;

The invention provides human G protein coupled protein receptor (HCPR) polypeptides and polynucleotides encoding them. The polypeptides can produced by standard recombinant methodology. The polynucleotides and polypeptides may be used in the prevention, treatment and diagnosis of

                                                                                                                                                                                                                                                                                                                                                                                                                               diseases associated with their inappropriate expression. Diseases that can be treated are cell proliferative disorders (e.g. arteriosclerosis, atherosclerosis and hepatitis), cancers (e.g. leukemia, melanomas and adenocarcinoma), immune disorders (e.g. anemia, asthma and Crohn's disease) and neurological disorders (e.g. epilepsy, Alzheimer's disease and Parkinson's disease). The anti-hgPCR antibodies may also be used as diagnostic agents for detecting the presence of HgPRP polypeptides in samples (e.g. by enzyme linked immunosorbant assay (ELISA)). Sequences AAY57283-288 represent the HGPRP polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                           Sequence

The endogenous and non-endogenous, constitutively activated versions of human G-protein coupled receptors (GPCR), are useful for direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists having applicability as therapeutic agents for treating diseases related to GPCR, e.g. lung cancer. Non-endogenous version of human GPCRs are also utilized in research settings and in vitro and in vivo system, incorporating GPCRs can be utilised to elucidate and understand the roles these receptors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 33; Page 105-106; 160pp; English.

cc (AAM99986-AAM99984) useful for preventing, treating or ameliorating conditions e.g. by protein or gene therapy. The genes are collated from a range of human tissues disclosed in the specification. Cc The nucleic acids, proteins, antibodies and (ant)agonists are useful cc in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone cmarrow, breast, gastrointestinal tract, liver, lung, or urogenital; cc marrow, breast, gastrointestinal tract, liver, lung, or urogenital; cc (b) immune disorders e.g. Addison's disease, allergies, autoimmune cc disease, multiple solerosis, rheumatoid arthritis and ulcerative cc olitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and cepilepsy; and (f) infectious diseases such as wiral, bacterial, fungal cand parasitic infections.

Cc Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formative.

                                                                                                 밁
                                                                                                                                                                                                                                                                                          Š
                                                                                                                                                                                                                                                                                                                                                                                                                                    $\times \times \
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to novel genes (AAI99548-AAI99604) and proteins CC (AAM99936-AAM9984) useful for preventing, treating or ameliorating cmedical conditions e.g. by protein or gene therapy. The genes are CC isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune thyroiditis, diabetes mellitus, Crohn's clisease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders s.g. cerebral anoxia and cepilepsy; and (f) infectious diseases such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and cepilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infectious diseases such as viral, bacterial, fungal cancer the sequence data for this patent did not form part of the

The invention relates to novel genes (AAL34669-AAL37666) and proteins (ABB03087-ABB04109) associated with the musculoskeletal system useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune discorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and urcarative colitis; (c) cardiovascular discorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolated polypeptide for treating, preventing and/or prognosing disorders related to the musculoskeletal system including musculoskeletal cancers and also for testing and detection e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides human cDNAs, proteins and related genomic DNAs. These can be used in the treatment of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative disorders and inflammation. The present sequence is a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                        Human; uterine motility-association disorder; uterus; pregnancy; labour; menstrual cycle; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        N-PSDB;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        uterine motility-association polypeptides, and cDNA (AAS28936-AAS28994) and genomic sequences encoding for these polypeptides. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of diseases associated with uterine motility such as pregnancy and labour, and menstrual disorders. The polynucleotide sequences of the invention are also useful in gene therapy. AAU18094-AAU18152 represent novel human uterine motility-association polypeptides.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

disorders
endocrine
Sequences AAU18282-AAU18507 represent endocrine polypeptides of the invention. Endocrine polypeptides and their associated polynucleotides are useful in the diagnosis, treatment and prevention of various types disorders in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. A pathological condition can be determined by determining the presence or absence of a mutation in an endocrine polynucleotide. The treatable disorders include autoimmune diseases suc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   as rheumatoid arthritis, hyperproliferative disorders such as neoplasms of the breast or liver, cardiovascular disorders such as cardiac arrest, cerebrovascular disorders such as cerebrovascular disorders such as cerebrovascular disorders such as cerebrovascular disorders such as corneal infection, endocrine disorders such as premature labour and infertility, gastrointestinal disorders such as crohn's disease, renal disorders such as glomerulonephritis and respiratory disorders such as sthma. The polypeptides can also be used to aid wound healing, to prevent skin aging due to sumburn, to maintain organs before transplantation, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

diagnosis, prognosis, prevention and/or treatment of diseases which include kidney disorders (e.g. renal failure or nephritis), cardiovascular disorders (e.g. hypertension or myocardial infarction), blood disorders (e.g. anaemia or blood coagulation disorders),
                                          The invention relates to novel nucleic acids and polypeptides useful diagnosing, treating, preventing and/or prognosing disorders related these polypeptides. The polynucleotides are especially useful in the diagnosis, prognosis, prevention and/or treatment of diseases which
                                                                                                                                                             preventing or prognosing electrolyte imbalance or
                                                                                                                     Claim
                                                                                                                                                                                          New polynucleotides and

The present invention relates to the isolation of novel human neoplastic disease associated polypeptides, and cDNA (AAS34767-AAS35050) and DNA sequences encoding for these polypeptides. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of disorders involving neoplastic disease such as hyperproliferative disorders (e.g. leukaemia, bone cancer, bladder cancer, brain stem glioma, adult liver cancer, childhood cerebellar astrocytoma, or Hodgkin's lymphoma). The sequences of the invention may also be useful for treating other disorders such as neural disorders, jumnune system disorders, muscular disorders, reproductive disorders, gastrointestinal disorders, pulmonary disorders, are cardiovascular disorders and renal disorders. The polynucleotide sequences of the invention are also useful in gene therapy. AAU21568-AAU21851 represent the novel human

The invention relates to novel genes (AAL34669-AAL37666) and proteins (AABB03087-ABB04109) associated with the musculoskeletal system useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and cother cancers of the adrenal gland, bone, bone marrow, breast, cother cancers of the adrenal gland, bone, bone marrow, breast, cother cancers of the adrenal gland, bone, bone marrow, breast, cother cancers of the adrenal gland, bone, bone marrow, breast, cother cancers of the adrenal gland, bone, bone marrow, breast, and control cancers e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, cullitiple sclerosis, rheumatoid arthritis and ulcerative colitis; comultiple sclerosis, rheumatoid arthritis and ulcerative colitis; comparison of the colitis of the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      17-NOV-2000;

The ORFX CC sequences have activities such as: cytostatic; hepatotropic; vulnerary; CC antipsoriatic; antiparkinsonian; nootropic; neuroprotective; costeopathic; anticonvulsant; antiarthritic; immunosuppressant; CC immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; cc antidiabetic; hypotensive; dermatological; immunosuppressive; cc antithyroid; and antianaemic. The sequences can be used for determining cc the presence of or predisposition to, or preventing or treating cc pathological conditions associated with an ORFX-associated disorder. The cnucleic acids can be used to express ORFX proteins in gene therapy coetors. The proteins and nucleic acids may be used to treat cancers, cc proliferative disorders, neurodegenerative disorders, osteoarthritis, cc dypertension, hypothyroidism, cholesterol ester storage, systemic lupus crythematosus, severe combined immunodeficiency (SCID), AIDS, viral, collegies, aplastic anaemia, burns, wounds, bone and cartilage damage, cc coagulation; to inhibit thrombosis; and as a contraceptive.
